Practical Lab Assignment 3

Pre-processing of missing values (using mean value of each attribute class):

Problem Statement: Replace the missing values for given automobile dataset “imports-85.data” with mean value of each attribute class. (Consider no. of doors as the class attribute - 6th attribute)

Create a Menu Driven Python program.

Dataset:
https://github.com/nyuvis/datasets/blob/master/auto/imports-85.data

Dataset Information :
https://archive.ics.uci.edu/ml/machine-learning-databases/autos/imports-85.names

Implementation:

```
#import the libraries
import pandas as pd
import numpy as np
from google.colab import files

#import the dataset
ds = pd.read_csv("https://raw.githubusercontent.com/nyuvis/datasets/master/auto/i
mports-85.data")

#replace the NaN value for "?" value
ds.replace("?",np.nan,inplace=True)

# convert the object class into float object
ds['normalized-losses'] = ds['normalized-losses'].astype(float)
ds['bore'] = ds['bore'].astype(float)
ds['stroke'] = ds['stroke'].astype(float)
ds['horsepower'] = ds['horsepower'].astype(float)
ds['peak-rpm'] = ds['peak-rpm'].astype(float)
ds['price'] = ds['price'].astype(float)

#creating the menu driven program
print("=============MENU=============")
print("1. Missing Values using MEAN")
print("2. Missing Values using MEDIAN")
print("3. Missing Values using MODE")
option = int(input("Enter Choice :- "))
